electrostatic latent image formed on an  
electrophotographic photosensitive member, said  
developing device being usable with a main assembly of  
an electrophotographic image forming apparatus, said  
developing device comprising;  
    a developing member for supplying a developer  
to the electrophotographic photosensitive member for  
developing the electrostatic latent image formed on  
said electrophotographic photosensitive member;  
        a first electrode provided opposed to  
developing member;  
        a second electrode disposed such that at  
least a lower end thereof takes a position lower than  
said first electrode when said developing device is  
mounted to the main assembly of the  
electrophotographic image forming apparatus;  
        wherein an electric signal is generated in  
accordance with an electrostatic capacity between said  
first electrode and second electrode when said first  
electrode or second electrode is supplied with a  
voltage from the main assembly of said  
electrophotographic image forming apparatus, and is  
measured by the main assembly of the  
electrophotographic image forming apparatus to detect

5 developing device being usable with a main assembly of  
an electrophotographic image forming apparatus, said  
developing device comprising;

0366 a developing member for supplying a developer  
to the electrophotographic photosensitive member for  
10 developing the electrostatic latent image formed on  
said electrophotographic photosensitive member;

a first electrode provided opposed to  
developing member;

Sub  
A1

a second electrode disposed such that at least a lower end thereof takes a position lower than said first electrode when said developing device is mounted to the main assembly of the electrophotographic image forming apparatus;

wherein an electric signal is generated in  
20 accordance with an electrostatic capacity between said  
first electrode and second electrode when said first  
electrode or second electrode is supplied with a  
voltage from the main assembly of said  
electrophotographic image forming apparatus, and is  
25 measured by the main assembly of the  
electrophotographic image forming apparatus to detect  
a remaining amount of the developer.

2. A device according to Claim 1, wherein said first electrode and said second electrode are disposed along a length of said developing member which is in the form of a developing roller.

5

3. A device according to Claim 1 or 2, wherein said first electrode and a frame supporting said second electrode constitute a recess extending parallel to said developing device frame, said recess opens downward.

10

4. A device according to Claim 1, 2 or 3, wherein each of said first electrode and second electrode has a plate shape, wherein a length of said first electrode, measured in a direction crossing with a longitudinal direction of said developing member, is longer than said second electrode.

15

5. A device according to Claim 1 or 2, wherein one and the other of said first and second electrodes are plate-like and rod-like electrodes.

20

6. A developing device for developing an electrostatic latent image formed on an electrophotographic photosensitive member, said developing device being usable with a main assembly of an electrophotographic image forming apparatus, said

25

developing device comprising;

a developing member for supplying a developer to said electrophotographic photosensitive member to develop the electrostatic latent image formed on said electrophotographic photosensitive member;

a first electrode disposed opposed to said developing member;

a second electrode disposed such that at least a lower end thereof takes a position lower than said first electrode when said developing device is mounted to the main assembly of the electrophotographic image forming apparatus;

a third electrode disposed between said second electrode and said developing member;

a first electrical contact for receiving, from the main assembly of said electrophotographic image forming apparatus, a voltage to be applied to said first electrode when said developing device is mounted to the main assembly of said

electrophotographic image forming apparatus;

a second electrical contact for receiving, from the main assembly of said electrophotographic image forming apparatus, a voltage to be applied to said developing member when said developing device is mounted to the main assembly of said electrophotographic image forming apparatus;

a third electrical contact for transmitting,

14. A device according to Claim 12 or 13, wherein  
5 said developer path electrode is in the form of a  
plate extending along the path.

15. A device according to Claim 13, further  
comprising a third electrode provided between said  
10 second electrode said second electrode and said  
developing member.

16. A device according to Claim 15, wherein said  
third electrode is a member which is integral with or  
15 separate from said second electrode, and is disposed  
opposed to said developing member.

---

*Sub  
A5*

17. A device according to any one of Claims 13-  
16, wherein said first electrode and said second  
20 electrode are arranged along a length of said  
developing member which is in the form of a developing  
roller.

18. A device according to any one of Claims 13-  
25 17, wherein said first electrode and a frame  
supporting said second electrode constitute a recess  
extending parallel to said developing member, and said

recess opens downward.

19. A device according to any one of Claims 13-  
18, further comprising and intermediary electrode  
5 between said developing member and said developer path  
electrode.

20. A device according to any one of Claims 14-  
19, further comprising developer stirring means for  
10 stirring the developer, wherein at least said first  
electrode and second electrode are disposed in a  
moving range of the developer provided by rotation of  
said developer stirring means.

21. A device according to any one of Claims 1, 6  
15 or 13, further comprising a stirring member for  
stirring the developer accommodated therein, wherein  
at least a lower end of said second electrode takes a  
position lower than said first electrode in a  
20 direction of movement of the developer provided by  
said stirring member, when said developing device is  
mounted to the main assembly of the  
electrophotographic image forming apparatus.

22. A process cartridge detachably mountable to a  
25 main assembly of an electrophotographic image forming  
apparatus, comprising:

32. A process cartridge according to any one of  
Claims 22-31, further comprising developer stirring  
means for stirring the developer, wherein at least  
said first and second electrodes are disposed in a  
moving range of the developer provided by rotation of  
said developer stirring means.

33. A process cartridge detachably mountable to a  
main assembly of an electrophotographic image forming  
apparatus, comprising:

(a) an electrophotographic photosensitive  
member; and

(b) a developing device including:

a developing member for supplying a developer  
to said electrophotographic photosensitive member to  
develop the electrostatic latent image formed on said  
electrophotographic photosensitive member;

a developer accommodating portion for  
accommodating the developer to be used for development  
of the electrostatic latent image by said developing  
member; and

a developer path electrode disposed along a

path along which the developer accommodated in said developer accommodating portion moves to said developing member;

wherein an electric signal corresponding to  
5 an electrostatic capacity between said developing member and said developer path electrode is generated when a voltage is applied to said developing member from the main assembly of said electrophotographic image forming apparatus, to permit detection of a  
10 remaining amount of the developer by measuring the electric signal.

34. A process cartridge detachably mountable to a main assembly of an electrophotographic image forming  
15 apparatus, comprising:

(a) an electrophotographic photosensitive member; and

(b) a developing device including:

a developing member for supplying a developer  
20 to said electrophotographic photosensitive member to develop the electrostatic latent image formed on said electrophotographic photosensitive member;

a first electrode provided so as to exhibit the same or potential as said developing member;

25 a second electrode disposed such that at least a lower end thereof takes a position lower than said first electrode when said developing device is

a stirring member for stirring the developer  
accommodated;

5 a second electrode which is disposed at a position different from that of said first electrode in a direction crossing with a moving direction of the developer provided by said stirring member;

wherein an electric signal is generated in accordance with an electrostatic capacity between said first electrode and second electrode when said first electrode or second electrode is supplied with a voltage from the main assembly of said electrophotographic image forming apparatus, and is measured by the main assembly of the electrophotographic image forming apparatus to detect a remaining amount of the developer.

68. A device according to Claim 67, wherein said  
20 first electrode and said second electrode are disposed  
along a length of said developing member which is in  
the form of a developing roller.

~~69. A device according to Claim 67 or 68, wherein~~  
25 ~~said first electrode and a frame supporting said~~  
~~second electrode constitute a recess extending~~  
~~parallel to said developing device frame, said recess~~

opens downward.

70. A device according to Claim 67, 68 or 69,  
wherein each of said first electrode and second  
5 electrode has a plate shape, wherein a length of said  
first electrode, measured in a direction crossing with  
a longitudinal direction of said developing member, is  
longer than said second electrode.

71. A device according to Claim 67 or 68, wherein  
one and the other of said first and second electrodes  
are plate-like and rod-like electrodes.

72. A process cartridge detachably mountable to a  
15 main assembly of an electrophotographic image forming  
apparatus, comprising:

(a) an electrophotographic photosensitive  
member; and

(b) a developing device including:

20 a developing member for supplying a developer  
to said electrophotographic photosensitive member to  
develop the electrostatic latent image formed on said  
electrophotographic photosensitive member;

25 a first electrode disposed opposed to said  
developing member;

a stirring member for stirring the developer  
accommodated;

a second electrode which is disposed at a position different from that of said first electrode in a direction crossing with a moving direction of the developer provided by said stirring member;

5            wherein an electric signal is generated in accordance with an electrostatic capacity between said first electrode and second electrode when said first electrode or second electrode is supplied with a voltage from the main assembly of said  
10    electrophotographic image forming apparatus, and is measured by the main assembly of the electrophotographic image forming apparatus to detect a remaining amount of the developer.

15           73. A process cartridge according to Claim 72, wherein said first electrode and said second electrode are disposed along a length of said developing member which is in the form of a developing roller.

20           74. A process cartridge according to Claim 72 or 73, wherein said first electrode and a frame supporting said second electrode constitute a recess extending parallel to said developing device frame, said recess opens downward.

25

75. A process cartridge according to Claim 72, 73 or 74, wherein each of said first electrode and second

a stirring member for stirring the developer accommodated;

a second electrode which is disposed at a position different from that of said first electrode  
5 in a direction crossing with a moving direction of the developer provided by said stirring member;

wherein an electric signal is generated in accordance with an electrostatic capacity between said first electrode and second electrode when said first  
10 electrode or second electrode is supplied with a voltage from the main assembly of said electrophotographic image forming apparatus, and is measured by the main assembly of the electrophotographic image forming apparatus to detect  
15 a remaining amount of the developer.

78. An electrophotographic image forming apparatus for forming an image on a recording material, wherein a process cartridge is detachably  
20 mountable to a main assembly of said electrophotographic image forming apparatus, said electrophotographic image forming apparatus comprising:

(a) an electrophotographic photosensitive  
25 member;

(b) mounting means for detachably mounting the process cartridge, the process cartridge including;

SECRET  
APB  
(Conf)

a developing member for supplying a developer to said electrophotographic photosensitive member to develop the electrostatic latent image formed on said electrophotographic photosensitive member;

5 a first electrode disposed opposed to said developing member;

a stirring member for stirring the developer accommodated;

10 a second electrode which is disposed at a position different from that of said first electrode in a direction crossing with a moving direction of the developer provided by said stirring member;

(c) electrostatic latent image forming means for forming the electrostatic latent image on said electrophotographic photosensitive member; and  
15

(d) developer amount detecting means for detecting an amount of the developer in said developing device on the basis of the electric signal transmitted from said third electric contact.

20

79. An apparatus according to Claim 77 or 78, wherein said first electrode and said second electrode are disposed along a length of said developing member which is in the form of a developing roller.

25

80. An apparatus according to Claim 77, 78 or 79, wherein said first electrode and a frame supporting
